Conclusion

Our goal:

- Detailed hands-on how-to manual for transparent social science research.
- Focus on implementing the solutions in research, less on convincing of the problems.
- Cover all aspects of a transparent research project, from beginning (study design, hypothesis registration) to end (publication, data sharing).
- Keep the manual updated.
- Encourage participation from the community.

Conclusion

- **Transparency is part of being an ethical researcher.**
- Admit that we're human, subject to bias and motivated reasoning, transparency can help with this (Nosek, Spies, Motyl 2012).
- Since a lot of us run experiments, we should take IRBs seriously as part of transparency (Ch. 11–13 Morton & Williams 2010, Desposato 2014).

Conclusion

Existence of the problem:

- Effect sizes diminish with sample size (Gerber, Green, Nickerson 2001)
- There is a higher fraction of rejected hypothesis tests in the social sciences (Fanelli 2010).
- Published null results are disappearing over time, in all disciplines (Fanelli 2011).
- Data on the complete set of experiments run shows strong results are 40pp more likely to be published, and 60pp more likely to be written up. The file drawer problem is large. (Franco, Malhotra, Simonovits 2014)

Replication

Project Protocol, Reporting Standards Workflow Data Sharing

Conclusion

If we only write up/publish significant results, and we have no record of all the insignificant results, we have no way to tell if our ‘significant’ results are real, or if they’re the 5% we should expect due to noise.

Workflow

Data Sharing

Conclusion

Explain the solution:

- Publicly stating all research you will do, what hypotheses you will test, prospectively.
- Near universal adoption in medical RCTs. Numerous journals won't publish if it's not registered.
<http://clinicaltrials.gov>
- Even better if registry requires outcomes from after study. Currently limited, but NIH is moving on this.

Conclusion

- Newer to social sciences, but:
 - AEA registry, currently only for RCTs.
<http://socialscienceregistry.org>
 - EGAP registry
<http://egap.org/design-registration>
 - 3ie registry, for developing country evaluations.
<http://ridie.3ieimpact.org>
 - Open Science Framework <http://osf.io>
 - Open format
 - Will soon sync with above

Reporting Standards
Workflow
Data Sharing

Conclusion

Define the problem:

- Also called fishing, researcher degrees of freedom, or data-mining.
- Definition: flexibility in data analysis allows portrayal of *anything* as below an arbitrary p-value threshold; significance loses its meaning.
- Not something only evil people do. It's subconscious, or simply built into statistics (Gelman, Loken 2013).

Pre-Analysis Plan

Pre-Analysis Plan

Replication

Project Protocol,
Reporting Standards
Workflow
Data Sharing

Conclusion

Explain the solution:

- From 3ie: “A pre-analysis plan is a detailed description of the analysis to be conducted that is written in advance of seeing the data on impacts of the program being evaluated. It may specify hypotheses to be tested, variable construction, equations to be estimated, controls to be used, and other aspects of the analysis. A key function of the pre-analysis plan is to increase transparency in the research. By setting out the details in advance of what will be done and before knowing the results, the plan guards against data mining and specification searching. Researchers are encouraged to develop and upload such a plan with their study registration, but it is not required for registration.”

Reporting Standards
Workflow
Data Sharing

Conclusion

Running Randomized Evaluations

- 1 the main outcome measures,
- 2 which outcome measures are primary and which are secondary,
- 3 the precise composition of any families that will be used for mean effects analysis,
- 4 the subgroups that will be analyzed,
- 5 the direction of expected impact if we want to use a one-sided test, and
- 6 the primary specification to be used for the analysis.

Conclusion

World Bank Development Impact Blog

- 1 Description of the sample to be used in the study
- 2 Key data sources
- 3 Hypotheses to be tested throughout the causal chain
- 4 Specify how variables will be constructed
- 5 Specify the treatment effect equation to be estimated
- 6 What is the plan for how to deal with multiple outcomes and multiple hypothesis testing?
- 7 Procedures to be used for addressing survey attrition
- 8 How will the study deal with outcomes with limited variation?
- 9 If you are going to be testing a model, include the model
- 10 Remember to archive it

P-Hacking

Pre-Analysis Plan

Replication

Project Protocol,
Reporting Standards
Workflow
Data Sharing

Conclusion

- 1 Authors must decide the rule for terminating data collection before data collection begins and report this rule in the article.
- 2 Authors must collect at least 20 observations per cell or else provide a compelling cost-of-data-collection justification.
- 3 Authors must list all variables collected in a study.
- 4 Authors must report all experimental conditions, including failed manipulations.
- 5 If observations are eliminated, authors must also report what the statistical results are if those observations are included.
- 6 If an analysis includes a covariate, authors must report the statistical results of the analysis without the covariate.

Conclusion

- J-PAL Hypothesis Registry (11), see <http://www.povertyactionlab.org/Hypothesis-Registry>, 6 published papers:
 - Sierra Leone CDD, Oregon Medicare, Turkey Job Training, El Salvador TOMS, two in Indonesia (Olken et al.)
- Hawkins, Fitzgerald, Nosek—Conception Risk and Prejudice

Wide range of when exactly to write and how detailed to make the plan. At the extreme level of detail you would have your entire code already written before you got any data.

Conclusion

Make sure you report everything another researcher would need to replicate your research.

- Find the appropriate reporting standard for your field and follow it: <http://www.equator-network.org/>
- Report the nuts and bolts of the project implementation in a detailed protocol:
<http://www.spirit-statement.org>

Conclusion

Post your code and your data in a trusted public repository.

- Find the appropriate repository:
<http://www.re3data.org/>
- Repositories will last longer than your own website.
- Repositories are more easily searchable by other researchers.
- Repositories will store your data in a non-proprietary format that won't become obsolete.

Conclusion

OK, how do I implement this in my own research?
Read the manual.

To do:

- Badges
- Registered Reports
- TIER
- Dynamic documents with R Markdown
- If you have suggestions, it's on GitHub for a reason.
